**Project Work**

A computer system is a general purpose device programmed to carry out a finite set of arithmetic or logical operations, and can solve more than one kind of problem. A computer system consists of at least one processing element and some form of memory. The arithmetic and logical operations are carried out by processing element, and sequencing and control unit that change order of operations is based on stored information. Computer system consists of peripheral devices, which allow information to be retrieved from an external source, and results are saved and retrieved. Keyboard, printer, scanner, monitor, joystick and routers are an example of peripheral devices.

Write a Project Report on the Topic **Computer System**. The Report should encompass working principle of computer system, organisation, and various types of software used in the system.
